Multilevel Analyses • Sometimes such data sets are referred to as "nested" or "hierarchically nested" because observations (also referred to as units of analysis) at one level of analysis are nested within observations at another level. • This nesting needs to be taken into account when you analyze the data.

Multilevel analysis allows for more than just accurate estimation of regression coefficients and standard errors due to non-independence and quantification of between-cluster variation (the ICC). As variables can be measured at different levels of the hierarchy, it allows for correct inferences about cluster-level variables to be made.

Multilevel Analysis (2nd ed.) by Snijders, Tom (ebook)

Multilevel additive models are adapted to model the relationships among variables to account for the hierarchical data structure. Data transformation is allowed to represent potential non-linear relationship. We also create an R package, mlma, that implements the proposed method for multilevel third-variable analysis. Using the package, TVEs on average as well as at different values of the exposure(s) can be estimated.
