This study investigated family functioning, family stage and eating disorder risk. A sample of 140 females (aged 18 - 59) completed a family functioning questionnaire (ICPS) and the Eating Disorder Risk scale (EDI-3). Consistent with previous research, cluster analysis identified two profiles of family functioning: an authoritative style (high intimacy and high democratic parenting, with low conflict) and an authoritarian cluster (elevated conflict scores and significantly lower intimacy and ...

The family, that most fundamental of human groups, is currently perceived to be changing in response to social, biological, cultural and technological developments in our postmodern society. While the observed changes in families have been considered by some sociologists to be evidence of adaptation and, therefore, normal, the authors of this volume, consider them maladaptive. Viewing society from the point of view of clinical psychiatry, they point to greatly increased numbers of children born to single mothers, soaring rates of divorce, a statistically confirmed increase in mental disorders, increase in reported incest, high rates of depression in younger people and escalation of the amount of reported family violence as evidence that the family, as a social institution, is in crisis and can either move toward renewed vitality or continued deterioration. Perceiving a need to obtain information about family functioning that might lead to the increased stability and well-being of this critically important type of system, Dr. John Schwab and his associates designed and carried out a research program that began with a thorough review of relevant literature beginning with LePlay ' s study of 300 families in the 1850 ' sand including important recent statistical studies. They found that although these studies represent advances in understanding the family system, some serious problems with the research remain, one of which is confounding variables such as family function and mental or substance abuse disorders so that if a family member has a problem, such as drug abuse, the family is classified as dysfunctional.

The primary challenge of delivering and evaluating family-based services lies in successfully assessing changes in families. This guide provides instruction for use of the Family Assessment Form (FAF), an instrument to help practitioners assess families at the beginning of service, develop individualized family service plans, monitor family progress, and assess outcomes for individual families. The FAF is designed as a standardized form that is adaptable for a variety of clinical, procedural, and program needs. Using a 9-point rating scale for individual items, the FAF enables practitioners to complete a psychosocial assessment of six areas of family functioning that is recorded in a quantitative manner and allows for monitoring family progress. The six areas of family functioning assessed by the FAF are: (1) living conditions; (2) financial conditions; (3) support available to caregivers; (4) interactions between caregivers and children; (5) developmental stimulation available to children; and (6) interactions between adult caregivers. The instruction guide provides a rationale for family assessment, details the development of the FAF, describes the FAF, provides information on training individuals to administer the instrument, describes the use of the FAF for program evaluation, discusses its test reliability and validity, and contains instructions for completing the FAF. A complete copy of the instrument is contained in the guide, including the "face sheet," the family functioning factors section, caregiver history and characteristics section, behavior concerns/observation checklist, and the service plan and closing summary. Contains 13 references. (KB)

This comprehensive text is organized into two parts, the first of which presents an overview of the history, development, and theory of the model, and its specific applications to treatment, training, assessment, and research. Part II includes the instruments and assessment tools originally developed by the authors during their extensive clinical and research experience. Clinical case examples drawn from over four decades of family therapy work enrich the text, and an entire chapter is devoted to the authors' own research findings, current research plans, and new directions in their work.
